LESSON AT A GLANCE

The class examined firsthand testimony from a factory worker to explore what working conditions were like during the era of the factory system, with students working in pairs to identify a claim about those conditions and support it with specific evidence from the text, including discussion of the long workday and why children were often employed.

FOLLOW-UPS

3

WHY WAIT TIME MATTERS

Three to five seconds of silence after a question is the single cheapest change most teachers can make. It feels much longer than it is.

3

Checks & Feedback

How you checked they were with you, and how specific your feedback was.

4

Clarity & Content

What the lesson said it was about, in its own words.

STATED OBJECTIVE

"Today we're going to look closely at what factory work was actually like for the people who lived through it."

KEY VOCABULARY MOMENTS

"Quick review first — the factory system is defined as a way of producing goods where workers, including a lot of kids, ran machines together in one building instead of making things by hand at home. Does that make sense?"

0:27

"Right, in other words it's a firsthand account — somebody describing what they lived through, not a textbook summarizing it."

1:12

CONNECTIONS TO THE WIDER WORLD

"That connects to something we'll keep seeing this unit, companies looking for the cheapest labor they can find."

7:25

"In real life, we still argue about working conditions today, this isn't just something from the past."

Rubric Lens

Danielson Framework for Teaching (2022): evidence from this lesson for each component. Not a rating.

2a Cultivating Respectful and Affirming Environments Audio shows part of this

Teacher language toward students was warm and encouraging, using a student's name positively and affirming responses ("Exactly, nice thinking," "Great point"). Audio can't capture facial expression, tone of voice nuance, or classroom climate beyond word choice.

"Exactly, nice thinking, Marcus." (0:54 · General praise · Encouraging language)

"Good, I like how you pointed to that specific detail instead of just saying it was dangerous in general." (5:56 · Encouraging language)

"Great point, that's exactly the kind of pushback we might expect from someone running the factory." (6:46 · Encouraging language)

Next step to try: Try naming a specific student contribution during transitions too, not just after answers, to extend the affirming tone throughout the lesson.

2b Fostering a Culture for Learning Audio shows part of this

Praise often named exactly what a student did well, such as pointing to specific evidence rather than a vague claim, and the lesson opened with a clear purpose tied to quality thinking. This suggests spoken expectations for precision in evidence use.

"Good, I like how you pointed to that specific detail instead of just saying it was dangerous in general." (5:56 · Encouraging language)

"I like how you pointed to the fourteen-hour day as evidence, not just said it was bad." (6:23 · Specific feedback)

"Today we're going to look closely at what factory work was actually like for the people who lived through it." (0:05 · Stated learning goal)

Next step to try: Consider adding a spoken expectation about persistence or revising work, since the current praise focuses on accuracy more than effort or improvement.

2c Maintaining Purposeful Environments Audio shows part of this

Directions for tasks were clear and specific (thirty seconds alone, then partner work to agree on a claim and evidence), though the automatic count shows zero detected spoken transitions between activities, meaning shifts may have been handled nonverbally or briefly.

"Okay, eyes up here, let's get started." (0:01 · Redirection)

"Thirty seconds on your own first — write down one thing that stands out to you." (2:03 · Task instruction)

"Alright, now work with your partner and agree on one claim and one piece of evidence." (2:40 · Task instruction)

Next step to try: Try adding a brief spoken transition line signaling when one activity ends and the next begins, to make shifts explicit for all students.

2d Supporting Positive Student Behavior Audio shows part of this

Only one redirection was detected, phrased briefly and neutrally, and the lesson moved forward right after it. Audio can't show whether other nonverbal redirections happened or how students behaved throughout.

"Okay, eyes up here, let's get started." (0:01 · Redirection)

3a Communicating About Purpose and Content Audio shows this well

The lesson opened with a stated learning goal, defined key vocabulary clearly (factory system, testimony), and connected content to a broader unit theme about labor costs. Explanations were concise and paired with checks for understanding.

"Today we're going to look closely at what factory work was actually like for the people who lived through it." (0:05 · Stated learning goal)

"Quick review first — the factory system is defined as a way of producing goods where workers, including a lot of kids, ran machines together in one building instead of making things by hand at home. Does that make sense?" (0:27 · Vocabulary defined)

"That connects to something we'll keep seeing this unit, companies looking for the cheapest labor they can find." (7:25 · Connection to prior knowledge or the real world)

3b Using Questioning and Discussion Techniques Audio shows this well

Questions included both recall (6) and higher-order (5) types, with average wait time around 3.5 seconds and 3 follow-up questions extending student thinking, such as asking how a factory owner might respond or what could have changed historically.

"How would a factory owner have answered that" (6:31 · Higher-order question, about 3.9s before a student answered)

"How would you feel if you worked a fourteen-hour day with no way to complain" (8:26 · Higher-order question, about 2.8s before a student answered)

"What could have changed if children weren't allowed to work in factories" (10:51 · Higher-order question, about 2.9s before a student answered)

Next step to try: Try adding one or two more follow-up questions after recall answers to push initial responses toward deeper reasoning.

3c Engaging Students in Learning Audio shows part of this

Students spoke in response to structured tasks (independent writing, then partner discussion producing a claim and evidence), with estimated student talk time around 22%. Audio can't confirm how many students participated beyond those who spoke into the microphone.

"Thirty seconds on your own first — write down one thing that stands out to you." (2:03 · Task instruction)

"Alright, now work with your partner and agree on one claim and one piece of evidence." (2:40 · Task instruction)

"We wrote that the testimony sounds angry, like frustrated, and our evidence is the part where she says 'we are not machines.'" (7:48 · Student response)

3d Using Assessment for Learning Audio shows this well

The teacher checked understanding through direct questions and a closing written reflection task, and gave specific feedback in most instances (12 of 14 feedback moments), such as clarifying vocabulary and naming strong evidence use.

"Right, in other words it's a firsthand account — somebody describing what they lived through, not a textbook summarizing it." (1:12 · Specific feedback · Vocabulary defined)

"I like how you pointed to the fourteen-hour day as evidence, not just said it was bad." (6:23 · Specific feedback)

"Before you leave, write down one thing you heard from another pair that changed your mind or added something you hadn't thought about." (11:14 · Check for understanding (An end-of-lesson written check.) · Task instruction)

3e Responding Flexibly to Student Needs Audio shows part of this

The teacher followed up on student responses with additional questions that pushed for reasoning from another perspective or deeper justification, showing responsiveness to what students had just said rather than moving on immediately.

"What evidence in the testimony backs that up" (5:38 · Follow-up question after a student response)

"How would a factory owner have answered that" (9:13 · Follow-up question after a student response)

"Why do you think she felt there was nothing else" (10:18 · Follow-up question after a student response)

Next step to try: Try building in a brief re-explanation or alternate example when a follow-up reveals a gap, to extend this responsiveness further.

2e Organizing Spaces for Learning: not in a recording. Room arrangement and materials are visual, so a recording can't show them.

7

Moments Worth Revisiting

Specific points in the recording, with timestamps.

5:38 Follow-up / probing question

"What evidence in the testimony backs that up?"

5:46 Longest wait time

"It said a girl named Ellen lost part of her finger in the loom because there was nothing covering the gears."

1:40

Longest uninterrupted teacher monologue

"Okay, let's hear what some of you came up with. Let's start over here — what did your pair put down?"

8

My Reflection

Your own words — the part that turns a report into a change.

STRENGTHS

The half-sheet worked. Eleven students spoke, and every pair had something written before anyone talked.

GROWTH AREAS

I still jumped in to explain once or twice before pairs had finished. The exit ticket answers were short.

MY NEXT STEP

Keep the half-sheet for Friday's source, and give pairs a full two minutes before I call on anyone.
